Claims

- A process for preparing a polymeric hydroperoxide 1. 5 a redox in reaction forms free-radical polymer but no low molecular weight free radical, characterized in that a synthetic comprising at least one tertiary hydroxyl group or olefin function is reacted with concentrated 10 hydrogen peroxide and a concentrated mineral acid.
 - 2. The process as claimed in claim 1, characterized in that H_2O_2 having a concentration of from 50 to 70% is used.
 - 3. process claimed in claim The 2, as characterized in that sulfuric acid having of from 50 80% concentration to is used concentrated mineral acid.
- 4. The process as claimed in any of the preceding claims, characterized in that the polymer is used as a solution in an organic solvent.
- 25 5. The process as claimed in any of the preceding claims, characterized in that a polysiloxane polyol, polyether polyol or polyester polyol is used as starting material.
- 30 6. The process as claimed in any of the preceding claims, characterized in that the reaction is carried out at a temperature of from +10 to +60°C.

Claims

- A process for preparing a polymeric hydroperoxide 1. 5 redox reaction forms free-radical in а polymer but no low molecular weight free radical, characterized in that a synthetic polymer which comprises at least one tertiary hydroxyl group or olefin function and has no further groups which 10 are reactive toward the peroxidation reagent used introduced into a mixture of concentrated hydrogen peroxide and a concentrated mineral acid.
- 7. The process as claimed in any of the preceding claims, characterized in that a polysiloxane polyol dissolved in a lower alcohol is used.
- 8. process for preparing copolymers by polymerization using a peroxidic polymerization characterized that, 2.0 initiator, in to avoid of homopolymers, hydroperoxide formation a synthetic polymer which prepared by adding a comprises at least one tertiary hydroxyl group or olefin function and has no further groups which are reactive toward the peroxidation reagent used 25 to a mixture of concentrated hydrogen peroxide and a concentrated mineral acid is used as polymerization initiator and the copolymerization is carried out at a temperature below 90°C.

30

- 9. The process as claimed in claim 8, characterized in that the polymer is used as a solution in an organic solvent.
- 35 claim 9, 10. The process claimed in or as characterized in that polyether polyol, a polyester polyol or polysiloxane polyol is used as starting material.
